**Abstract**

Background- India is the second most populous country in the world having a rapidly growing population which is currently increasing at the rate of 16 million each year. Uncontrolled population growth is recognised as the single most important impediment to national development.

Methods- A cross sectional study was conducted on females between 15-45 years served as inclusion criteria, while unmarried females were excluded. The women interviewed were informed of the study and consent was taken.

Results- A total of 100 married females of reproductive age were enrolled in the study. The study shows, mean age of respondent was 29.2 ± 8.6 years. Out of 100 women, 62 (62.00%) had knowledge about family planning. 62.00% respondent thought that contraceptives were used to prevent pregnancy and about 13.00% thought that they could be used to prevent infections like AIDS. Only 9.00% thought that they could be used to control birth interval.

Conclusions- Effort should be made to educate the public about the safety and convenience of modern, long term, reversible methods of contraception among both in health care professional and public.

**Keyword:** Knowledge, Attitude, Practice, Contraception

**Introduction**

Family planning is defined by WHO as “a way of thinking and living that is adopted voluntarily, upon the basis of knowledge, attitudes and responsible decisions by individuals and couples, in order to promote the health and welfare of family groups and thus contribute effectively to the social development of a country”.

India is the second most populous country in the world having a rapidly growing population which is currently increasing at the rate of 16 million each year.¹ Uncontrolled population growth is recognised as the single most important impediment to national development. Instead of the fact that India was the first country in the world to implement a national population control programme in 1952, we are still struggling to contain baby boom. A lot of efforts and resources have gone into the national family welfare programme but the returns are not commensurate with the inputs to control the population.²

In developing countries Couple Protection Rate (CPR) is still very less. According to national family welfare statistics 2011, CPR in India is 40.4%. In Pakistan CPR was 30% in 2011 while most developed country like USA has 71% CPR for all methods.³,⁴

Now a days fertility rate has come down due to widespread use of family planning methods, whereas some developing countries like India, Pakistan, the use of contraception is still low because of lack of awareness, education, religion, cultural, economic and political barrier. Proper counseling for family planning necessary because 27% of women are at risk of unplanned pregnancy.⁵

The essential aim of family planning is to prevent the unwanted pregnancies. An unwanted pregnancy may lead to an induced abortion. From the point of view of health, abortion outside the medical setting is one of the most dangerous consequences of unwanted pregnancy.⁶ Keeping this in mind one cross sectional study was carried out to assess the knowledge, attitude and practices of contraceptives of reproductive females.

**Material and Methods**

A cross sectional study was conducted on females between 15-45 years served as inclusion criteria, while unmarried females were excluded. The women interviewed were informed of the study and consent was taken. The participation was on voluntary basis. Questions regarding factors responsible for non use of contraception were also asked.

**Statistical Analysis**

The descriptive data was presented as number and percentages with mean and standard deviations, wherever required. The Chi square test was used for analysing the categorical data. The unpaired “t” test was used to compare the mean between the two groups. A p-value
<0.05 was considered to be statistically significant. The data collected were analysed with Medcalc 16.4 version software.

**Results**

A total of 100 married females of reproductive age were enrolled in the study. The study shows, mean age of respondent was 29.2 ± 8.6 years.

**Table 1: Knowledge regarding different contraceptive methods**

<table>
<thead>
<tr>
<th>Contraceptive methods</th>
<th>Number</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condom</td>
<td>61</td>
<td>61.00%</td>
</tr>
<tr>
<td>OCP</td>
<td>60</td>
<td>60.00%</td>
</tr>
<tr>
<td>IUCD</td>
<td>51</td>
<td>51.00%</td>
</tr>
<tr>
<td>Injectable</td>
<td>7</td>
<td>7.0%</td>
</tr>
<tr>
<td>Tubectomy</td>
<td>49</td>
<td>49.0%</td>
</tr>
</tbody>
</table>

Out of 100 women, 62 (62.00%) had knowledge about family planning. 61.00% knew about condom, followed by OCPs & other methods.

**Table 2: Knowledge regarding emergency contraceptive methods**

<table>
<thead>
<tr>
<th>Knowledge regarding emergency contraceptive methods</th>
<th>Number</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>6</td>
<td>6.0%</td>
</tr>
<tr>
<td>No</td>
<td>94</td>
<td>94.00%</td>
</tr>
</tbody>
</table>

Only 6.0% Women were aware of emergency contraceptive.

**Table 3: Attitude towards use of contraception**

<table>
<thead>
<tr>
<th>Attitude</th>
<th>Number</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used to prevent pregnancy</td>
<td>62</td>
<td>62.00%</td>
</tr>
<tr>
<td>Used to prevent AIDS &amp; STDs</td>
<td>13</td>
<td>13.00%</td>
</tr>
<tr>
<td>Used to control birth interval</td>
<td>9</td>
<td>9.00%</td>
</tr>
</tbody>
</table>

62.00% respondent thought that contraceptives were used to prevent pregnancy and about 13.00% thought that they could be used to prevent infections like AIDS. Only 9.00% thought that they could be used to control birth interval.

**Discussion**

62.00% were aware of at least one of family planning methods in our study. Ambareen Khanet al\(^7\) mentioned that 81% had awareness regarding any method of contraception. Tuladhar H et al\(^8\) also observed that the most common source of information on contraception was media (55.5%), and both printed and electronic.

In the present study knowledge about emergency contraception was quite low (6.0%).

Contraceptive usage in our study was 62.00%. Sunita Ghike\(^3\) also mentioned various for non-use of contraceptive methods. The main reason 59% were pressure from family that is from husband, in-laws, son preference and physical pressure.

Family planning services need to provide a range of quality method that can allow women to either limit or space birth and to fulfill the need of women with differing socio-demographic characteristics. In our study though majority of interviewer women had knowledge about family planning methods but practicing is still low because of lack of education, cultural, religion, economical and political barriers.

**Conclusion**

Despite the high rate of sexual activity in the study group, the contraceptive usage rate is low. There is a need for aggressive advocacy about female reproductive health and dissemination of information on family planning methods among the reproductive females. Fear of side effects of contraception is one significant reason for low compliance. This can be decreased by proper selection of contraception before starting its use and adequate follow up of women using contraception by the family planning services.
